

8.2.2 Setting the Distance

Set the distances from the tool's center of gravity to the end of the robotic arm, which can be determined by CAD software tools.

The following are the examples of using the DRASimuCAD software to determine the distances between the tool's center of gravity and the end of the robotic arm. After obtaining the results, you can enter the X-, Y-, and Z-axis values in the CoGx, CoGy, and CoGz fields respectively.

Distances between tool's center of gravity and end of SCARA	Distances between tool's center of gravity and end of VA
	

Important: DRASstudio calculates the distances for the robot in units of meters. Pay attention when converting between units.
