

(Figure 3-20: Single Module System_ Wiring between the Display, SVG Module and CT)

- SVG modules can be stacked directly during installation, and we suggest installing maximum 7 modules in one cabinet. **Figure 3-21** is the module installation diagram. Please refer to **Figure 3-22** for connecting CT and communication wires for double and multiple SVG modules scenario. Make a connection from the HMI's communication port to that of SVG module. When several SVG modules are connected in parallel, it is unnecessary to connect other modules to HMI connection wire; instead, communication can be established via connections between the system's internal wires.
